

Cross Transfer Turner

01

- Controlled handling
- Automatic parallel transfer
- Reduced cycle times
- High versatility
- Operational safety

Description

The Cross Transfer Turner is a handling system designed to pick up a panel, lift it, and rotate it by 90° while maintaining full control of its position. After rotation, the panel is transferred parallel to its original plane.

The unit consists of two crossed axes: one dedicated to lifting and rotation, and the other to linear transfer. This configuration ensures smooth and precise movement, reduces cycle times, and improves safety when handling panels of various sizes.
